

# Buffer Program

## What to Plant in Buffers

March 3, 2017

**Purpose:** The purpose of this document is to provide planting guidance relating to Minnesota's Buffer Law, based on conservation program requirements, intended uses, and landscape conditions. Local conservation staff, as well as natural resource and crop consultants, can provide additional site-specific guidance.

## What to Plant

**Buffer Plantings Not Funded by Programs** - When not using federal, state and/or local program funding, landowners have a variety of options for buffer vegetation.

*Prairie Vegetation* - Prairie plants have deep roots that provide water infiltration and filtering, and provide wildlife habitat benefits. They can also be used as a source of biomass. Native seed vendors can provide local buffer seed mixes to match site conditions. [State seed mixes](#) have also been developed by state agencies for a variety of conservation purposes (saturated buffers, biomass/biofuels, pollinator plantings, etc.). Buffers may be an opportunity to plant species beneficial to pollinators (milkweeds, Black-eyed Susan, wild mints, asters, goldenrods etc.) in addition to native grasses. Pesticide drift is a concern for pollinators, so forbs are not recommended in buffer strips that are thirty feet wide or less and adjacent to cropland where pesticides are applied. Refer to [NRCS Agronomy Tech note #9](#) for mitigation practices related to protecting pollinators from pesticide applications.

Prairie grasses and flowers

*Hay and Forage Crops* - A variety of perennial vegetation that is commonly used for hay and forage crops, such as alfalfa, clovers and forage grasses can be used for buffer plantings. NRCS practice standard CPS-512 Forage and Biomass Planting found in [Agronomy Technical Note #31](#) provides seeding recommendations.

Buffer planted with hayed forage grasses

*Perennial Grains* – Grains that are perennial can be planted and later harvested from buffer areas. Kernza is an example of a species with increasing seed availability. More information is available about Kernza and other perennial species on the website for the [Forever Green Initiative](#) at the University of Minnesota.

*Woody Vegetation* – In addition to their ability to stabilize soils, woody vegetation can provide many other landscape benefits. Species such as Choke Cherry, Ninebark, Prairie Plum, Highbush Cranberry, Indigo Bush and Dogwood provide habitat for pollinators, songbirds and other wildlife. Some species such as Elderberry, Chokeberry, Hazelnuts and Willows are also being grown as [commercial crops](#). Woody plants should be planted in combination with prairie vegetation or other perennial groundcover species to ensure effective stormwater filtering and to suppress weeds.

## What Not to Plant

**Invasive Species and State Noxious Weeds** – Minnesota's Buffer Law states that invasive species and [state noxious](#) weeds cannot be planted on required buffers. The invasive risk of plants is often based on landscape conditions. For example, reed canary grass is a species that is often discouraged as it displaces native vegetation in wetland and riparian landscapes. DNR's [invasive species website](#) includes species that can be harmful to native plant communities.

**Avoiding Palmer Amaranth and Other Weeds** – The Minnesota Department of Agriculture is increasing inspections of seeds for native and non-native species to help prevent the introduction of [Palmer Amaranth](#). For plantings with native seed, work with native seed vendors to obtain local sources. Inspect plantings for weeds and work with local conservation staff, Extension agents, or consultants if any problems are identified.

Common tansy, a state noxious weed

## What to Plant if You are in a Conservation Program

**Buffer Plantings Funded by Conservation Programs** – Federal, state and local conservation programs can be used for planting buffers. Each program has guidance for the types of vegetation to be used and for seed sources. Local [SWCD staff](#) can provide information about programs and funding options.

*Federal Funding* - Plantings conducted through the Conservation Reserve Enhancement Program ([CREP](#)) involve a perpetual Reinvest in Minnesota conservation easement and require the use of native vegetation, while Conservation Reserve Program ([CRP](#)) and Environmental Quality Incentive Program ([EQIP](#)) plantings can include native or non-native species depending on project goals. For federal programs, NRCS Field Office Technical Guide (FOTG) practice standards are used, along with [Agronomy Technical Note #31](#) to define applicable practice standards and seed source requirements.

*State Funding* – NRCS conservation practice standards including CPS-327 Conservation Cover and CPS-393 Filter Strip are also used for state (BWSR) funded projects, but only native vegetation species can be used. [BWSR's Native Vegetation Guidelines](#) define seed source requirements focused on using locally adapted species to the extent feasible. The BWSR [Buffer Establishment and Management Toolbox](#) provides additional detailed information for project planning and implementation, including plant selection.

*Local Funding* – In addition to guiding buffer projects, local Soil and Water Conservation Districts may know of additional local funding sources, as might watershed districts and local conservation organizations. Individual funding sources will have specific guidance for planting options.

## Additional Information

For information about how to assess when a buffer is meeting vegetation requirements of Minnesota's Buffer Law, see the BWSR Buffer Law Implementation Guidance document titled [Vegetation Establishment Goals](#).
